

Problem 5.22

$$\mathbf{A} = \frac{\mu_0}{4\pi} \int \frac{I \hat{z}}{r} dz = \frac{\mu_0 I}{4\pi} \hat{z} \int_{z_1}^{z_2} \frac{dz}{\sqrt{z^2 + s^2}}$$

$$= \frac{\mu_0 I}{4\pi} \hat{z} \left[\ln \left(z + \sqrt{z^2 + s^2} \right) \right]_{z_1}^{z_2} = \frac{\mu_0 I}{4\pi} \ln \left[\frac{z_2 + \sqrt{(z_2)^2 + s^2}}{z_1 + \sqrt{(z_1)^2 + s^2}} \right] \hat{z}$$

$$\begin{aligned} \mathbf{B} &= \nabla \times \mathbf{A} = -\frac{\partial A}{\partial s} \hat{\phi} = -\frac{\mu_0 I}{4\pi} \left[\frac{1}{z_2 + \sqrt{(z_2)^2 + s^2}} \frac{s}{\sqrt{(z_2)^2 + s^2}} - \frac{1}{z_1 + \sqrt{(z_1)^2 + s^2}} \frac{s}{\sqrt{(z_1)^2 + s^2}} \right] \hat{\phi} \\ &= -\frac{\mu_0 I s}{4\pi} \left[\frac{z_2 - \sqrt{(z_2)^2 + s^2}}{(z_2)^2 - [(z_2)^2 + s^2]} \frac{1}{\sqrt{(z_2)^2 + s^2}} - \frac{z_1 - \sqrt{(z_1)^2 + s^2}}{z_1^2 - [(z_1)^2 + s^2]} \frac{1}{\sqrt{(z_1)^2 + s^2}} \right] \hat{\phi} \\ &= -\frac{\mu_0 I s}{4\pi} \left(-\frac{1}{s^2} \right) \left[\frac{z_2}{\sqrt{(z_2)^2 + s^2}} - 1 - \frac{z_1}{\sqrt{(z_1)^2 + s^2}} + 1 \right] \hat{\phi} = \frac{\mu_0 I}{4\pi s} \left[\frac{z_2}{\sqrt{(z_2)^2 + s^2}} - \frac{z_1}{\sqrt{(z_1)^2 + s^2}} \right] \hat{\phi}, \\ &\text{or, since } \sin \theta_1 = \frac{z_1}{\sqrt{(z_1)^2 + s^2}} \text{ and } \sin \theta_2 = \frac{z_2}{\sqrt{(z_2)^2 + s^2}}, \\ &= \frac{\mu_0 I}{4\pi s} (\sin \theta_2 - \sin \theta_1) \hat{\phi} \text{ (as in Eq. 5.35).} \end{aligned}$$

Problem 7.2

(a) $V = Q/C = IR$. Because positive I means the charge on the capacitor is *decreasing*, $\frac{dQ}{dt} = -I = -\frac{1}{RC}Q$, so $Q(t) = Q_0 e^{-t/RC}$. But $Q_0 = Q(0) = CV_0$, so $Q(t) = CV_0 e^{-t/RC}$.

Hence $I(t) = -\frac{dQ}{dt} = CV_0 \frac{1}{RC} e^{-t/RC} = \frac{V_0}{R} e^{-t/RC}$.

(b) $W = \frac{1}{2} CV_0^2$. The energy delivered to the resistor is $\int_0^\infty P dt = \int_0^\infty I^2 R dt = \frac{V_0^2}{R} \int_0^\infty e^{-2t/RC} dt = \frac{V_0^2}{R} \left(-\frac{RC}{2} e^{-2t/RC} \right) \Big|_0^\infty = \frac{1}{2} CV_0^2$. ✓

(c) $V_0 = Q/C + IR$. This time positive I means Q is *increasing*: $\frac{dQ}{dt} = I = \frac{1}{RC}(CV_0 - Q) \Rightarrow \frac{dQ}{Q - CV_0} = \frac{1}{RC} dt \Rightarrow \ln(Q - CV_0) = -\frac{1}{RC}t + \text{constant} \Rightarrow Q(t) = CV_0 + ke^{-t/RC}$. But $Q(0) = 0 \Rightarrow k = -CV_0$, so $Q(t) = CV_0 (1 - e^{-t/RC})$. $I(t) = \frac{dQ}{dt} = CV_0 \left(\frac{1}{RC} e^{-t/RC} \right) = \frac{V_0}{R} e^{-t/RC}$.

(d) Energy from battery: $\int_0^\infty V_0 I dt = \frac{V_0^2}{R} \int_0^\infty e^{-t/RC} dt = \frac{V_0^2}{R} (-RC e^{-t/RC}) \Big|_0^\infty = \frac{V_0^2}{R} RC = CV_0^2$.

Since $I(t)$ is the same as in (a), the energy delivered to the resistor is again $\frac{1}{2} CV_0^2$. The final energy in the capacitor is also $\frac{1}{2} CV_0^2$, so **half** the energy from the battery goes to the capacitor, and the other half to the resistor.
