Physics 507
EM II: Classical Electrodynamics
Fall 2006

Instructor: C. Durfee
Office: Meyer 330, **phone:** x3894, **email:** cdurfee@mines.edu
Class: Meyer 363, MWF 9:00-9:50 **plus 1 hour TBA**
Office hours: TBA

Summary:
This is a course in electrodynamics in which you will learn how the EM fields propagate, including how they radiate and interact with matter. Topics include using the Maxwell equations to describe propagation of free and guided waves, polarization, retarded potentials and radiation theory, scattering and dispersion theory, interference, and diffraction theory. We will discuss many applications, including antennas, diffraction gratings, resonators and guided waves. This course concentrates primarily on electrodyanamics rather than statics – many of the methods for solving the static equations will be discussed as examples in the mathematical physics class (PHGN511).

This class is combined with the undergraduate, senior-level advanced EM course, but we will cover several advanced topics (see below) by meeting for an extra hour weekly. You will be expected to do the same homeworks as the other students, plus an additional 3 or 4 assignments. The midterms will be the same, but the final will be different for those taking the graduate version.

I will provide handouts from various sources to supplement the reading from Heald.

Undergraduates are welcome to take the graduate version – it is recommended if you are going into the combined BS/MS program in Applied Physics. Students in 462 are welcome to come to the additional lectures if there are particular topics of interest.

507 Extra topics
- Wave propagation in anisotropic media: tensor dielectric functions
- Relativistic EM
- Lagrangian techniques in EM
- More rigorous approach to retarded fields
- Complete fields and spectrum of a radiating dipole, vector potl treatment
- Bremsstrahlung and Cerenkov radiation
- Causality and the Kramers-Kronig dispersion relations
- Antenna arrays
- Introduction to nonlinear optics
- Green's functions and diffraction
- Fresnel diffraction, transition to geometrical optics
- Variational approach to wave propagation
